**DETAILED ACTION**

***Allowable Subject Matter***

1. Claims 1-24 are allowed.
2. The following is an examiner's statement of reasons for allowance:
  - a. Applicant disclosed an inventive concept to provide a method for protection against employment of unallowed consumables in devices, that largely minimizes the employment of unallowed consumables. Unallowed consumables" means expired, old consumables as well as those of poor quality from other manufacturers, particularly pirated products. Applicant's inventive concept is novel and innovative in the sense that it aggregates each physical authentic tangible replacement consumable product, corresponding to said electronically represented tangible consumable product, with said generated code word, by generating an identification number embodying the generated code word and aggregating the identification number with each physical authentic tangible replacement consumable product during manufacture of each authentic tangible replacement consumable product at a manufacturer as recited in claim 1 and 23, and receiving a message from said data center identifying whether said proposed, tangible replacement consumable product is authorized, and said microprocessor modifying operation of said device, with regard to permitting usage of said proposed, tangible consumable product in said device, dependent on said message as recited in claim 7 and 23. Silverbrook (2003/0112419) the closest prior art teaches a body, a printing cartridge being engageable with the body, the printing cartridge having a housing, a media supply arrangement positioned within the housing and containing a supply of media and a feed

mechanism positioned in the housing for feeding the media to a printing mechanism, a barcode being depicted on the housing and carrying data relating to the media.

Silverbrook fails to teach aggregates each physical authentic tangible replacement consumable product, corresponding to said electronically represented tangible consumable product, with said generated code word, by generating an identification number embodying the generated code word and aggregating the identification number with each physical authentic tangible replacement consumable product during manufacture of each authentic tangible replacement consumable product at a manufacturer as recited in claim 1 and 23, and receiving a message from said data center identifying whether said proposed, tangible replacement consumable product is authorized, and said microprocessor modifying operation of said device, with regard to permitting usage of said proposed, tangible consumable product in said device, dependent on said message as recited in claim 7 and 23.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

### *Conclusion*

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

*b. Walker et al (U.S. Patent No. 6,494,562) teach a replaceable printing component for use in a printing system having at least one replaceable printing component. The replaceable printing component is of the type sold through a plurality of sales channels. The replaceable printing component includes a radio frequency link for receiving information indicative of a particular sales channel of a plurality of sales channels. Also included in the replaceable printing component is an electrical storage device for storing information indicative of the particular sales channel. The electrical storage device provides information indicative of the particular sales channel for reordering the replaceable printing component.*

*c. Haines (GB 2354735) disclose an inventive concept of encrypting data stored in a memory on a replaceable component of a printing to prevent unauthorized access to the memory in order to deter counterfeit cartridge vendors from having the ability to read data from an authentic cartridge that could thereafter be stored in the memory of a counterfeit cartridge.*
